9. Test results

9.1 Conducted emission measurement

9.1.1 Test procedure

- **For equipment tested as table-top:**
  The EUT is placed on a non-conductive 0.8 meters high table, 0.4 meters from the vertical conducting wall of the shielded room with EUT being connected to the power mains through a line impedance stabilization network (LISN). LISN provide 50 Ohm / 50 μH + 5 Ohm of coupling impedance for the measuring instrument.

- **For equipment tested as floor-standing:**
  The EUT is placed on a non-conductive 0.1 meters high support, 0.4 meters from the vertical conducting wall of the shielded room with EUT being connected to the power mains through a line impedance stabilization network (LISN). LISN provide 50 Ohm / 50 μH + 5 Ohm of coupling impedance for the measuring instrument.

- Sufficient time for the EUT, support equipment, and test equipment was allowed, for them to warm up to their normal operating condition.

- If device is a DC powered device with no dedicated AC/DC power converter, a random converter is provided to the test set-up.

- AC power lines of EUT are checked for maximum conducted interference.

- The frequency range from 150 kHz to 30 MHz is searched using PEAK, QUASI-PEAK and AVERAGE function of the receiver.

- If applicable functions are changed (data transfer speed, clock speed.…) it should be noted in the test report.

9.2 Radiated emission measurement

9.2.1 Test procedure

- **For equipment tested as table-top:**
  The EUT is placed on a non-conductive 0.8 meters high table with EUT being directly or via AC/DC power supply connected to the power mains.

- **For equipment tested as floor-standing:**
  The EUT is placed on a non-conductive 0.1 meters high table with EUT being directly or via AC/DC power supply connected to the power mains.

- The EUT is set 3 m away from the interference-receiving antenna, which was mounted on the top of variable-height antenna tower.

- The antenna is a broadband antenna, and its height is varied from one meter to four meters above the ground to determine the maximum value of the field strength. Both horizontal and vertical polarizations of the antenna are set to make the measurement.

- For each suspected emission, the EUT is arranged to its worst case and then the antenna was tuned to heights from 1 meter to 4 meters and the turn table is turned from 0 degrees to 360 degrees to find the maximum reading.

- The test-receiver system is set to Peak Detect Function and Specified Bandwidth with Maximum Hold Mode.

- The highest points are to be re-tested one by one using the quasi-peak method.

- In case of a Class A device in frequency range of up to 1 GHz, a calculation of highest 5 points is made from 3m to a 10 m distance. For points over 10 dB under the limit, the calculation is not performed.

- CMAD has not been applied in test setup.
